Experiment -1

AIM: To create an AWS free tier account to provision the resources.

Description:

Amazon Web Services (AWS) is a cloud computing platform that provides services such as computing, storage, databases and networking over the internet. The AWS Free Tier helps new users learn and experiment with selected AWS services within specified free usage limits.

To use AWS, a user must first create an account. The account is accessed through the AWS Management Console, a web-based interface used to view and manage cloud services. During registration, AWS asks for contact information, email and phone verification, and payment details for account verification. Some services may involve charges if their free usage limits are exceeded, so the limits and conditions should be checked before launching resources.

Steps:

1. Open a web browser and visit the official AWS website.

2. Select the option to create an AWS account. Enter a valid email address and choose an account name.

3. Verify the email address using the verification code sent by AWS.

4. Enter the required contact information, including the account holder's name, address and phone number.

5. Provide the requested payment information. AWS may use it for identity and payment verification.

6. Complete phone verification by entering the code received through the selected verification method.

7. Select the Basic Support plan (or the basic support option currently offered) and complete registration.

8. Sign in to the AWS Management Console using the registered email address and password.

9. Explore the console dashboard and check the AWS Free Tier page for eligible services, usage limits and conditions before creating resources.

Output:

The AWS account registration process provides access to the AWS Management Console. From the console, users can view and manage cloud services such as computing, storage and databases. The Free Tier section helps users check eligible services and their usage limits. Thus, the procedure for creating an AWS account and accessing the cloud service dashboard is understood.
